English : Upper-Intermediate

KEO SIVPHANCHART

Profile

DevOps Engineer with hands-on production experience at Hattha Bank, working on banking infrastructure, monitoring, observability, event management, and DevSecOps practices. Experienced in building monitoring platforms, centralized alert systems, and automation tools using Prometheus, ELK, Golang, Linux, Docker, Jenkins, Kubernetes, and related DevOps technologies.

Work Experience

Hattha Bank

Aug 2025 - Present

Monitoring, Observability & Event Management

- Built and maintained an enterprise-grade Prometheus monitoring platform covering 370+ devices (servers, network equipment, and physical hardware) in a regulated banking environment with high availability requirements.
- Designed and developed a centralized Event Management System that aggregates and normalizes alerts from Prometheus, ELK, and other monitoring sources into a single pane of glass for operations teams.
- Integrated monitoring across heterogeneous infrastructure including Linux/Windows servers, VMware virtualization, network devices (switches, routers, firewalls), and bare-metal hardware using exporters and SNMP-based collection.
- Developed a Golang-based web UI and RESTful APIs to automate Prometheus configuration management and device onboarding, reducing manual configuration effort and human error.
- Implemented alert deduplication, severity classification, and routing rules to reduce alert noise and ensure the right teams receive actionable notifications.
- Integrated Telegram notifications for real-time incident alerts, improving mean time to acknowledge (MTTA) for critical events.
- Automated monthly monitoring and availability reports for management, improving visibility into infrastructure health and SLA compliance.
- Defined and tuned alerting thresholds and recording rules in PromQL to balance early detection with false-positive reduction.

DevSecOps & CI/CD Pipeline

- implementation of DevSecOps practices by embedding automated security checks into CI/CD pipelines, shifting security left so issues are caught before deployment.
- Built and maintained end-to-end delivery workflows using Git, Jenkins, Docker, a private container registry, and RKE2.
- Integrated early-stage security gates into the pipeline, including dependency scanning (SCA), container image vulnerability scanning, secret detection, and static code quality validation.
- Applied secure pipeline practices such as centralized secret management, and role-based access control across CI/CD tooling.
- Implemented GitOps-style continuous delivery to RKE2 using Jenkins agents, improving deployment consistency and enabling fast, auditable rollbacks.
- Standardized Docker image build processes and registry policies to ensure only scanned, approved images reach production.
- Improved overall deployment reliability and release frequency by automating build, test, and deployment stages that previously required manual intervention.

Security, Compliance & Operations

- Supported security-focused monitoring and day-to-day infrastructure operations in a banking environment subject to strict regulatory.
- Applied secure configuration baselines, least-privilege access control, and continuous alert visibility across systems.
- Supported PCI-DSS-related infrastructure practices, including log retention, segmentation awareness, access reviews, and evidence gathering for audits.
- Troubleshoot and resolved incidents spanning servers, monitoring tooling, and RKE 2 workloads, performing root cause analysis to prevent recurrence.
- Participated in incident response by correlating alerts across monitoring sources to accelerate detection and diagnosis of issues.
- Collaborated with infrastructure, security, and application teams to expand monitoring coverage, close observability gaps, and continuously improve alert quality and runbooks.
- alert handling guides, and onboarding processes to strengthen team knowledge sharing .

Email : sovannarith@rupp.edu.kh

Freelance

June 2024 - Aug 2025

School Management System

- Collaborated with the school's IT team to maintain reliable daily operations of the platform.
- Developed administrative features for a School Management System using Next.js, including schedule management (timetables, teacher assignments) and attendance tracking modules.
- Integrated the frontend with backend RESTful APIs, handling data fetching, validation, and error handling for a smooth user experience.
- Built responsive user interfaces with Tailwind CSS and shadcn/ui, with reusable components (tables, forms, dialogs) for consistency across modules.
- Gathered feedback from administrators and teachers, translating requirements into practical feature improvements.

Image Server — Go Microservice

- Built a RESTful microservice in Go (Fiber) for uploading, validating, storing, and serving images, including a health-check endpoint for orchestration and monitoring.
- Designed a pluggable storage abstraction layer supporting both local disk and AWS S3 backends, allowing storage backends to be swapped without modifying handler code.
- Implemented server-side upload validation (file size and type) and hierarchical multi-tenant storage paths to organize media by entity and category.
- Containerized the service using a multi-stage Docker build with Docker Compose and Nginx reverse-proxy configuration for a production-style deployment.
- Added graceful shutdown handling and environment-based configuration with configurable CORS for deployment flexibility.

Personal Project

Rent Management System

- Built a Windows desktop app in C# (.NET 8, WinForms) to manage a rental/boarding house business, covering room management, utility billing, and tenant payments.
- Developed a billing engine that calculates water/electricity charges from meter readings with configurable rates, plus dual-currency payment tracking (USD and Riel) with automatic change calculation.
- Designed a layered architecture with SQL Server data access, dependency injection, PDF receipt generation, and Excel export.

EDUCATION

BACHELOR OF COMPUTER SCIENCE

2022 - 2025

Royal University of Phnom Penh

SAMSUNG INNOVATION CAMPUS

Sep 2022 - Feb 2023

Coding and Programming by Python
Awarded Scholarship
